## ***Abstract***

This describes the activities the Applications Workgroup is chartered to perform, such as creating specifications, and new versions of them. The workgroup directs the other workgroups to find solutions needed by particular applications, and may or may not respond to questions from implementors.

## 1. Introduction & Purpose

This document describes the goals and scope of the Application Workgroup.

## 2. Charter

The Applications Workgroup is responsible for the set of applications that the workgroup develops and maintains a specification for. The applications are specified using concepts specified in the other TEXP.net workgroups.

The application specification describes features and requirements for an implementor of the application. Implementors that fulfill all the requirements may then label their offering using the TEXP.net application name.

### 2.1. Adding Applications

The Applications Workgroup develops and publishes specifications for applications as they mature.

### 2.2. Publishing New Versions

As the understanding of the applications matures and implementation feedback is coming to light, the Applications Workgroup may publish updated versions of existing applications.

### 2.3. Directing the Interaction and Technical Workgroups

The Applications Workgroup may ask the other workgroups to research or develop concepts and terminology useful for some application under development.

### 2.4. Responding to Questions from Implementors

Implementors may be requesting clarification or guidance in their implementation work. If the Applications Workgroup comes to a rough consensus regarding the answers, it may respond. In case rough consensus is not reached, the answer is unknown or the matter not considered important enough by the workgroup, there is no obligation to respond.
